2 7 2015

REPLY TO THE ATTENTION OF:

Mr. Morgan Mullikin
President
Castalloy Corporation
1701 Industrial Lane
Waukesha, Wisconsin 53187-7397

Re: Notice of Violation

Compliance Evaluation Inspection

EPA ID: WID056068802

Dear Mr. Mullikin:

On May 20, 2015, a representative of the U.S. Environmental Protection Agency inspected the Castalloy Corporation ("Castalloy") located in Waukesha, Wisconsin. As a small quantity generator of hazardous waste, Castalloy is subject to the Resource Conservation and Recovery Act, 42 U.S.C. § 6901 et seq. (RCRA). The purpose of the inspection was to evaluate Castalloy's compliance with certain provisions of RCRA and its implementing regulations related to the generation, treatment and storage of hazardous waste. A copy of the inspection report is enclosed for your reference.

Based on information provided by Castalloy, EPA's review of records pertaining to Castalloy, and the inspector's observations, EPA has determined that Castalloy has unlawfully stored hazardous waste without a license or interim status as a result of Castalloy's failure to comply with certain conditions for a license exemption under Wis. Admin. Code § NR 662.192(1) and (4) [40 C.F.R. § 262.34(c)-(f)]. EPA has identified the license exemption conditions with which Castalloy was out of compliance at the time of the inspection in paragraphs 1-4, below.

The conditions identified in paragraphs 1-2 are also independent license exemption requirements for generators that are in and of themselves violable.

The conditions identified in paragraphs 3-4 are also independent license exemption requirements incorporated from Wis. Admin. Code ch. NR 665 [40 C.F.R. Part 265] that apply to permitted and interim status hazardous waste management facilities that treat, store, or dispose of hazardous waste (TSDF requirements). When a hazardous waste generator loses its license exemption due to a failure to comply with an exemption condition incorporated from the TSDF requirements, the generator: (a) becomes an operator of a hazardous waste storage facility; and (b) simultaneously violates the corresponding TSDF requirement in Wis. Admin. Code ch. NR 665 [40 C.F.R. Part 265] if the facility should have fully complied with the requirements for interim status, or Wis. Admin. Code ch. NR 664 [40 C.F.R. Part 264] if the facility should have been permitted.

Lastly, EPA has determined that Castalloy violated RCRA requirements related to hazardous waste determinations, manifests, and universal waste, as described in paragraphs 5-7, below.

STORAGE OF HAZARDOUS WASTE WITHOUT A LICENSE OR INTERIM STATUS THROUGH VIOLATIONS OF LICENSE EXEMPTION REQUIREMENTS AND OF TSDF REQUIREMENTS

The license exemption conditions identified in paragraphs 1 and 2, below, are also license exemption requirements violated by Castalloy:

1. Emergency Procedures

Under Wis. Admin. Code §§ NR 662.192(1)(e)2.a.-c. [40 C.F.R. §§ 262.34(d)(5)(ii)(A)-(C)], a small quantity generator must post the following information next to the telephone:

- The name and telephone number of the emergency coordinator next to the telephone.
- Location of fire extinguishers and spill control material, and if present, fire alarm.
- The telephone number of the fire department, unless the facility has a direct alarm.

At the time of the inspection, Castalloy did not identify the emergency coordinator for the facility in their telephone list next to the telephone. Also, though Castalloy did have a list of emergency equipment near the phone, this list did not include locations of fire extinguishers, spill control material, or the fire alarm.

2. Personnel Training

Under Wis. Admin Code § NR 662.192(1)(e)3. [40 C.F.R. § 262.34(d)(5)(iii)], a small quantity generator must ensure that all employees are thoroughly familiar with proper waste handling and emergency procedures, relevant to their responsibilities during normal facility operations and emergencies.

At the time of the inspection, it did not appear that facility personnel had been familiarized with hazardous waste management requirements and procedures relevant to their job responsibilities. For example, on at least two occasions, wastes that had been determined to be hazardous were shipped off-site as non-hazardous waste because inappropriate waste profile numbers were applied to the shipment. See Paragraph 6 for additional information.

The license exemption conditions identified in paragraphs 3 and 4, below, are also independent TSDF requirements violated by Castalloy:

3. Maintenance and Operation of Facility

Under Wis. Admin. Code §§ NR 662.192(1)(d) and 665.0031 [40 C.F.R. §§ 262.34(d)(4) and 265.31] a small quantity generator of hazardous waste must maintain the facility to minimize the possibility of a fire, explosion, or any unplanned sudden or non-sudden release of hazardous waste or hazardous waste constituents to air, soil, or surface water which could threaten human health or the environment.

At the time of the inspection, Castalloy had determined wastes generated from the plasma and arc air cutters to be a hazardous waste. The table on which the cutting takes place and the

surrounding area appeared to be accumulating these wastes, which may negatively affect the health of the workers in that area.

4. Arrangements with Local Authorities

Under Wis. Admin. Code §§ NR 662.192(1)(d) and 665.0037(1)(d) [40 C.F.R. §§ 262.34(d)(4) and 265.37(a)(4)], a small quantity generator of hazardous waste must make arrangements to familiarize local hospitals with the properties of hazardous waste handled at the facility and the types of injuries or illnesses which could result from fires, explosions, or releases at the facility.

At the time of the inspection, Castalloy had not familiarized the local hospital with potential injuries that employees could incur at the facility.

Summary of license exemption conditions: By violating the conditions for a license exemption, above, Castalloy became an operator of a hazardous waste storage facility, and was required to obtain a Wisconsin hazardous waste storage license. Castalloy failed to apply for such a license. Castalloy's failure to apply for and obtain a hazardous waste storage license violated the requirements of Wis. Admin. Code §§ NR 680.30, 680.31, and 680.32 [40 C.F.R. §§ 270.1(c), and 270.10(a) and (d)]. Any failure to comply with a license exemption condition incorporated from Wis. Admin. Code ch. NR 665 is also an independent violation of the corresponding TSDF requirement.

WASTE DETERMINATION, MANIFEST, AND UNIVERSAL WASTE VIOLATIONS

5. Hazardous Waste Determination

Under Wis. Admin. Code § NR 662.011[40 C.F.R. § 262.11], a generator must determine whether its waste is hazardous. A generator must keep records of any test results, waste analyses, or other determinations made in accordance with Wis. Admin. Code § NR 662.011[40 C.F.R. § 262.11]. See, Wis. Admin Code § NR 662.040(3) [40 C.F.R. § 262.40(c)].

Castalloy generates and mixes the following waste streams prior to shipment of the combined waste stream to a non-hazardous landfill:

- Grinding swarf from grinding operations (including the diamond grinder);
- Floor sweepings from facility housekeeping;
- Sand fines from foundry pouring, cooling, and shakeout operations; and
- Shot blast fines from finishing operations.

A combined sample of foundry sand and blasting wastes was used to make a non-hazardous waste determination for each of the above individual waste streams. Castalloy did not use separate samples for each waste stream to determine if the individual streams were hazardous prior to mixing. Additionally, it was not determined during the inspection whether the coreless induction furnaces generated wastes from air emission control devices. Documentation of a waste determination for this material, if generated, was not presented during the inspection.

6. Hazardous Waste Manifests

Under Wis. Admin. Code § NR 662.020 [40 C.F.R. § 262.20], a generator who transports, or offers for transport, a hazardous waste for offsite treatment, storage or disposal, must prepare a Manifest on EPA Form 8700-22.

On the following three separate occasions, Castalloy failed to prepare a hazardous waste manifest for discarded bag house dust filter cartridges and/or discarded bag house dust, both of which have been determined to be characteristically hazardous for chromium:

- 12-11-2013 (waste tracking number 121103)
- 3-3-2015 (waste tracking number 030318)
- 5-1-2015 (waste tracking number 050120)

Note: According to an e-mail from Mr. Bryan Burton of Castalloy dated June 24, 2015, the root cause of this violation was the inadvertent use of an outdated non-hazardous waste profile for these waste streams. This profile has since been deactivated. EPA does not request any further response for this violation.

7. Universal Waste Requirement

Under Wis. Admin. Code § NR 673.14(5) [40 C.F.R. § 273.14(e)], a small quantity handler of universal waste must label or clearly mark each lamp or a container or package in which such lamps are contained with any one of the following phrases: "Universal Waste-Lamps," "Waste Lamps" or "Used Lamps."

At the time of the inspection, Castalloy's containers of lamps were not labeled with the phrase "Universal Waste-Lamps," "Waste Lamps" or "Used Lamps."

CONCLUSION

At this time, EPA is not requiring Castalloy to apply for a Wisconsin hazardous waste storage license so long as it immediately establishes compliance with the conditions for a license exemption outlined in paragraphs 1-4, above.

According to Section 3008(a) of RCRA, EPA may issue an order assessing a civil penalty for any past or current violation, requiring compliance immediately or within a specified time period, or both. Although this letter is not such an order or a request for information under Section 3007 of RCRA, 42 U.S.C. § 6927, we request that you submit a response in writing to us no later than 30 days after receipt of this letter documenting the actions, if any, which you have taken since the inspection to establish compliance with each of the above conditions and requirements. You should submit your response to Brenda Whitney U.S. EPA, Region 5, 77 West Jackson Boulevard, LR-8J, Chicago, Illinois 60604.

If you have any questions regarding this letter, please contact Ms. Whitney, of my staff, at 312-353-4796 or at whitney.brenda@epa.gov.

Sincerely,

Gary J. Victorine, Chief

RCRA Branch

RCRA Branch

Land and Chemicals Division

Prepared By:

Brenda Whitney – Environmental Engineer

Date

6-2-15

Approved By:

Julie Morris – Chief, Compliance Section 2

Date

Purpose of Inspection

I conducted an unannounced Compliance Evaluation Inspection (CEI or "Inspection") of the Castalloy Corporation ("Castalloy" or "Facility") located in Waukesha, Wisconsin, on May 20, 2015. This CEI was an evaluation of Castalloy's compliance with the RCRA hazardous waste regulations codified in the Wisconsin Administrative Code and the Code of Federal Regulations. The Facility has notified as a small quantity generator of hazardous waste generating less than 1,000 kilograms of hazardous waste per month. Dolores Hayden of the WDNR was unable to participate in this CEI.

Participants

Morgan Mullikin – President Castalloy

Katie Hunkins – Safety Coordinator Castalloy

Terry Jahnke – Maintenance Manager Castalloy

Brenda Whitney – Environmental Engineer U.S. EPA

Introduction

I displayed official credentials to the Facility personnel upon arrival at Castalloy at approximately 8:30 a.m. I signed the visitor logbook and was introduced to Mr. Mullikin and Mr. Jahnke. During an introductory briefing with these facility representatives, I delineated the purpose and logistics of the CEI, and explained that I would be taking photographs in the facility as needed. I also explained that the inspection stemmed in part from an Agency review of the Toxic Release Inventory (TRI) database and of OSHA press releases. Mr. Mullikin clarified that the OSHA complaint noted in a press release dated June 4, 2013, was dropped and no penalty was assessed.

Site Description

The following information about Castalloy is based on the personal observations of the EPA inspector and on representations made during the Inspection by the Facility personnel identified above or within the text.

Castalloy opened its doors in 1973, with a second addition opening in 1980, and the third and final section competed in 1988. Currently, the facility occupies 100,000 ft² of manufacturing and office space and houses approximately 100 employees. Castalloy is a separate entity under the umbrella of Noricon, a holding company. Although there are several Castalloy companies throughout the world, they are in no way related either to this facility or to Noricon.

According to the website www.castalloycorp.com, Castalloy produces high alloy abrasion, corrosion, and heat-resistant commercial castings and offers engineering design, non-destructive testing, machining, fabrication, and assembly at their facility. The alloys used at this facility include iron, chromium, molybdenum, manganese, carbon, nickel and various other components depending on customer specifics. It did not appear that lead was used in this facility. The molds and cores for the casts are made with sand. Two types of molds are used; shell or Airset. Three types of cores can be made; shell, Isocure, or air set. Each type of mold and core is made using a different method. Each method is specifically used to correlate permeability, set time, and grain fineness of the sand to the type and temperature of the metal alloy that will be poured into the mold.

The furnaces used at this facility are coreless induction furnaces, which use eddy currents to heat the metal and do not purify with oxygen like electric arc furnaces. It is more efficient to melt larger pieces of metal in these furnaces than it is to melt bits and scraps. Prior to 2011, Castalloy used to send all of the scrap metal generated at the facility and from customer returns to scrap yards for direct reuse in other foundries. This meant that Castalloy would need to purchase additional feedstock for its own processes and make each alloy recipe from scratch. In 2011, Castalloy began sending its own scrap metal to be treated at a facility with an argon oxygen decarburization (AOD) furnace. The AOD oxidizes the metal to refine it and remove any tramp elements such as hydrogen, tin, and nitrogen. The refined metal is cast into 15-pound ingots and is sent back to Castalloy. According to Mr. Mullikin, there are no tolling agreements or contracts for this work. By sending scrap metal off to the AOD, Castalloy realizes at least three benefits: they get to use alloys that more closely resemble (or are identical to) what they blend on a daily basis; they do not have to purchase as much feed stock; and, the larger mass of metal in 15-pound ingot form burns more efficiently in the induction furnaces.

Incidentally, because Castalloy is sending the scrap metal off-site for processing prior to receiving the metal back, this material is considered by Castalloy to be reclaimed. Each shipment of chromium-containing alloy sent to an AOD facility is now included on their TRI report. Because of this action, the TRI report shows releases of chromium that jumped from nearly zero to more than 34,000 pounds in 2011. Castalloy sent approximately 119,000 pounds to the AOD in 2013 which contained an estimated 20%, or 23,800 pounds, of chromium. They reported 23,828 total chromium released in 2013.

Castalloy can be considered a job shop or boutique, meaning that they do small customized orders. Typical pours range from ounces up to 500 pounds. The largest crucibles and ladles in the facility hold 750 pounds.

The molds for the casts are formed around customer-designed patterns and are made using silica sand, some of which is pre-coated with bonding agents. Shell molds and cores are made with pre-coated sand that is set using only heat. Air set molds and cores start with un-coated sand that is mixed in-house with a two part binder that creates a resin. The resin is set with a chemical catalyst, which sets slowly. The "Isocure" method is used only for cores and also uses un-coated sands mixed with a two part binder, but then the sand is injected with isocyanate gas as the catalyst for a nearly instantaneous set.

Mold and core sand is recycled in-house by being processed through a mechanical classifier, which is an elevator tower that has a series of screens to separate the sand by grain size. The fines from this process are landfilled as non-hazardous waste. The remaining sand is either directly reused on site or is processed through a thermal reclamation unit. The thermal reclamation unit burns off the remaining volatiles from the sand so that it can also reused on site. All sand is stored in three silos. One holds mechanically separated sand; the second holds thermally reclaimed sand; and the third holds new sand.

The alloys themselves are created according to recipe cards. The operator calculates the weight of each component necessary per combination based on known percentages of elements in the feedstock. The charges are placed into the furnaces, which operate during the night shift. Each heat is checked with spectroscopy to ensure proper mixing ratios. The molten metal is poured into the molds through gate assemblies. When the cast cools, the molds are broken off, often

with sledgehammers, and the gates are cut off using arc air or plasma cutters. The rough cast is smoothed in a sand blasting unit and also manually with grinders. The finished product is inspected and shipped off-site.

Wastes generated at this facility include dust and swarf from grinding, welding, and cutting. Welding and cutting wastes are collected as hazardous waste, whereas the grinding dust is managed as non-hazardous. Floor sweepings, shot blast, and sand fines are collected as non-hazardous waste. The Isocure process uses a scrubber for air emissions. The scrubber beads and water have been determined to be non-hazardous. The furnaces use a closed-loop, non-contact cooling water system. This water is never discharged and is only added to for make-up of evaporative losses. Used oil is collected for recycling as are universal waste lamps and batteries.

Site Tour

Mr. Mullikin and Ms. Hunkins accompanied me on a tour of the facility. Castalloy uses the warehouse of the Wheelabrator site across Industrial Lane as a storage area for spill metal and miscellaneous parts. Castalloy provides cast components for Wheelabrator as a trade-off. It was not made clear during the inspection of any other monetary or rental/lease agreement between the two companies for use of this space. The inspection began in this warehouse. Mr. Mullikin explained that the spill metal is categorized by batch so that the alloy composition is tracked for each yard box of scrap before it goes off-site for reclamation in the AOD. Also in this area were yard boxes of returned ingots which will be used as feed stock at the Castalloy facility. Hazardous waste was not observed in this area.

The tour of the Castalloy facility began in the northwest corner and worked toward the southeast portion of the facility. I observed a diamond wheel grinding robot. The material that was being finished was a high-carbon steel. At 68% carbon, the steel was so hard that ordinary grinding material was insufficient. The dust from this operation was being collected in an adjacent baghouse, which emptied into a 55-gallon drum. The drum was not labeled. Mr. Mullikin stated that the material would not cause an air hazard to the employees because it was operated by an automated system. So the waste was not being managed as hazardous. Mr. Mullikin also stated that most particulates in the facility are directly landfilled.

From this area we could see the general welding area which was behind curtains. Mr. Mullikin stated that the waste collected in the baghouse for the welding area is managed as hazardous waste. I did not observe the drum collecting this waste.

The inspection continued through the grinding/finishing area to the maintenance area that was located at the middle of the east side of the facility. Mr. Jahnke pointed out the collected universal waste lamps, which were kept in several 4-foot boxes on the third tier of a storage rack. Mr. Jahnke stated that the containers were not marked. I observed that each box was closed (See Appendix A: Photograph 1). In the same area, but on the ground level, Mr. Jahnke pointed out a 250-gallon tank for used oil. The tank was labeled as "Used Oil" (See Appendix A: Photograph 2). No other waste was observed in this area. No other containers of used oil were observed throughout the facility.

The south end of the facility houses production. I observed the arc air and plasma cutting equipment. Scraps and dust had collected on and around the work table (See Appendix A: Photograph 3). The bag house collectors attached to the equipment funneled into two separate 55-gallon drums. Each drum was labeled as "Hazardous Waste" (See Appendix A: Photographs 4-6). The shot blasting unit was directly behind the cutters. The shot is reused on-site until it is too fine. The fines are sent off-site as non-hazardous waste.

I next observed the mold and core-making operations. The binder used in the sand contains formaldehyde which off-gases when exposed to heat. The operators in this area have to wear respirators. The operators fill a rectangular box with loose sand to make one half of a mold. Sand that is wasted from this part of the operation is sent to a landfill. Half of a pattern is placed into the sand, and, depending on the procedure, the mold is either heated (shell process) or set with a chemical catalyst (air set process). The pattern is then removed from the sand, and the hardened mold is fitted with cores as needed. The cores are made in a separate room. In this room, I noticed the scrubber for the Isocure process. The pellets and liquid from the scrubber are managed as non-hazardous waste. After one half of the mold is fitted with the cores, the matching halves of the mold are placed one on top of the other by robot. Hazardous waste was not being managed in these areas.

The inspection continued to the alloy-charging station. Mr. Mullikin explained how the recipe cards are used by the blending operators and where the blend is staged before being charged in the furnaces. North of the charging station was the thermal reclamation unit for the sand. West of the area are the ladles and crucibles. I did not observe these, as they were shrouded at the time of the inspection and were not operating. This part of the process operates at night. Near this area I observed the cooling deck for the casts as well as the classifier tower for the spent sand. Hazardous waste containers were not observed in any of these areas.

End of Tour

Records and Emergency Preparedness Review - Small Quantity Generator

Preparedness and Prevention: The facility is equipped with telephones, internal announcement systems, fire extinguishers, spill control equipment, and decontamination equipment. The facility is not sprinkled due to the fact that it is a foundry and molten/extremely heated metals react violently with water. The emergency equipment is tested and inspected according to a facility safety schedule. Emergency arrangements have been made with the LEPC which includes the local fire and police departments. Castalloy has an existing emergency response contract with AAA Environmental Response Company. Waukesha Memorial has not been familiarized with the potential injuries that could be incurred by employees at this facility. Aisle space appeared adequate throughout the facility.

Manifests: Manifests, land disposal restriction notices and other shipping records were not immediately available for review, and will be requested post-inspection.

Training: At the time of the inspection, it did not appear that the Castalloy employees had a working knowledge of RCRA and may not have been trained in hazardous waste

management practices. Bryan Burton, HR Manager, and John Braatz were identified during the inspection as being the primary and alternate emergency coordinators, respectively.

Emergency Posting by Phone: A posting by the phone in Ms. Hunkins office showed the layout of the facility along with a list of available emergency equipment. The locations of the emergency equipment were not included. She also had a posting that included contact information for the fire department. The emergency coordinators phone numbers were also on this posting, however, they were not identified as the emergency coordinators.

Waste Determinations: According to the information gathered during the inspection, all waste determinations have been made using generator knowledge. The accuracy of the determinations will be further discussed with Castalloy.

Weekly Inspections: Castalloy does not maintain a regular hazardous waste storage area.

According to the consultant, waste that is removed from the satellite accumulation areas is staged for less than three days near the equipment where they were generated.

Closing Conference

During the closing conference with the Mr. Mullikin, I discussed my observations noted during the inspection and asked some outstanding questions from the inspection checklists. I informed Mr. Mullikin that I would be generating a report that included a letter, narrative discussion of the CEI and attendant photographs and checklists. Any response needed from Castalloy according to the letter would be expected within 30 days. I provided three informational handouts: SHWEC Environmental Programs (WDNR brochure); P2 Technical Assistance Contacts; and U.S. EPA Small Business Resources.

The following items were discussed with Mr. Mullikin at the close of the inspection.

- I would be requesting any analytical data that they may have on file for the wastes generated at this facility:
- I would be requesting all shipping documents including hazardous waste manifests, land disposal restriction forms, and bills of lading for universal waste and used oil.
- Universal waste labeling;
- Information discussed and collected throughout the inspection was not claimed as confidential business information.

WASTE & MATERIALS MANAGEMENT PROGRAM

This Inspection Form, used for the inspection of facilities that generate between 100 kg (220 lbs) and 1000 kg (2205 lbs) of non acute hazardous waste in a calendar month and less than 1 kg of acute hazardous waste in a calendar month, evaluates facility compliance with Wisconsin's Hazardous Waste Management Rules (chapter NR 660 - 679, Wis. Admin. Code).

Revision: 10/31/2011 WASTE & MATERIALS MANAGEMENT PROGRAM

SMALL QUANTITY GENERATOR INSPECTION

Section 2: Manifest, Pre-Transport Requirements and Off-Site Shipments オッタに作品にも K. Upon receipt of the rejected shipment, the generator signed EITHER of the following: 662.192(5) DURING INSP. 1. Manifest Item 18c if the transporter returned the shipment using the original manifest. Photo 2. Manifest Item 20 if the transporter returned the shipment using a new manifest. L. Copy of the manifest is signed by the generator and retained until the signed copy from the 662.193(1)(a) NU designated facility is received. Photo M. Copy of each manifest is kept for at least three years from the date of shipment. 662.193(1)(a) OH Photo -うそうにゅっと ろと N. Hazardous waste is packaged according to applicable DOT requirements before transport 662,190,(2) (NR 662.030). Photo O. Hazardous waste is labeled according to applicable DOT requirements before transport 662.190(2) ACCORDING TO FACILITY REP Photo P. Hazardous waste is marked according to applicable DOT requirements before transport 662.190(2) (NR 662,032(1)). 克克 ACCEDING TO FACILITY REP Photo -Q. Containers of 119 gallons and less are marked with the "Hazardous Waste - Federal law 662.190(2) prohibit improper disposal" label before transport (NR 662.032(2)). Photo R. Placards are offered to the initial transporter (NR 662.033). 662.190(2) DO NOT SUP N/O PROPER Photo -Section 3: Land Disposal Restrictions A. Generator determined if each waste is prohibited from land disposal by lab analysis or 668.07(1) generator knowledge, Photo B. Generator complies with the prohibition against dilution of wastes. 668.03 Photo _ C.A one-time written notice is sent to each treatment, storage or disposal facility with the initial 668.07(1) waste shipment. Photo D. A new notification is sent to the TSD and maintained in the generator file when the waste or 668.07(1) NIA receiving facility changes. Photo E. If the waste MEETS treatment standards, the LDR notice certifies the wastes may be land 668.07(1) NA ACSPONSIBLE disposed without further treatment. Photo F. If the waste EXCEEDS treatment standards, the LDR notice notifies of appropriate 668.07(1) υH treatment and applicable prohibitions. Photo _ G. Copy of the LDR notifications and certifications are retained for at least 3 years from the 668.07(1)(h) UN date the waste was last sent off-site. Photo

UNIVERSAL WASTE HANDLER INSPECTION REPORT - SMALL QUANITY HANDLER

This Inspection Form, used for the inspection of facilities that generate or handle less than 5000 kg of universal waste (hazardous waste batteries, pesticide, lamps, antifreeze, and some mercury containing devices), evaluates facility compliance with Wisconsin's Hazardous Waste Management Rules (chapters NR 660-679, Wis. Admin. Code). The Universal waste regulations streamline the requirements for hazardous waste batteries, pesticide, lamps, antifreeze, and some mercury containing devices. Persons treating, disposing, recycling, or otherwise processing universal wastes are subject to applicable hazardous waste regulations.

on 1: Pronibitions		
		070 44(4)
A. Universal waste is not disposed on-site.	V	673.11(1)

Dear Ms. Whitney,

Attached to this email is the information you requested in your email of June 3, 2015 following the inspection at the Castalloy facility on May 20th. Below is a response to each of your requests:

1. Please provide all manifests for shipments of hazardous waste for the past three years (May 2012 through May 2015). You need only include the final copy which has been signed by the receiving facility.

> I have attached all manifests for shipments of hazardous waste for the past three years (May 2012) through May 2015).

- 2. If not clearly stated on the manifests provided in response to Item 1, above, please indicate the following
 - a. The source of the waste streams (by line item)
 - b. The disposition of the waste stream (e.g. landfill, recycle, etc.)

The waste streams are stated on the manifests, but to clarify, the bag house dust and the bag house filter cartridges (also referenced as 'Arc Air / Plasma Fume Collector'), as referenced in Section 14 on the manifests, are from the Air Arc process. The Safety Kleen solvent (i.e., identified as 'Waste Combustible Liquid' in section 9 of the manifests) is the spent solvent from the parts washer from our maintenance department.

Provide Land Disposal Restriction (LDR) forms for each hazardous waste (only one form needed per waste stream) sent off-site for disposal. You do not need to include LDRs for wastes that have not been sent off site in over three years.

> The Safety Kleen waste manifest come with an LDR attached to each one. I have also attached the LDRs for the chromium waste from the Arc Air process, which accompanied the first shipment of each of the two associated waste streams (i.e., baghouse dust and filter cartridges).

- 4. Hazardous waste determinations must be made for all solid wastes generated at your facility [see, 40 CFR 262.11]. Generator knowledge may be used to make determinations. A generator may also use sample analyses, such as the Toxicity Characteristic Leaching Procedure (TCLP), in order to make the determinations. All determinations must be supported with written documentation [see, 40 CFR 262.40(c)]. Provide waste determination documentation for the following waste streams:
 - a. Grinding Swarf
 - b. Cutter dust (from the electric arc air cutter and plasma cutter)
 - c. Dust collected in the welding area
 - d. Floor sweepings
 - e. Sand fines
 - Shot blast fines

g. Parts washer solvent (if applicable)

I have attached a spreadsheet to detail this information for you on the hazardous waste determinations.

5. Provide transporter and receiving facility information for used oil generated on the site. Include the name and EPA ID number of both entities. Also indicate whether the oil is going to be reprocessed, burned, or otherwise.

This is also detailed on the attached spreadsheet, as also indicated on the respective manifests.

- 6. For used oil, provide one or more of the following, as applicable:
 - a. the total halogen analytical results;
 - b. information documenting whether or not used oil is mixed with listed hazardous waste (e.g., a chlorinated solvent) if total halogens exceed 1,000 ppm.

Safety Kleen field screens the used oil using Chlor-D-Tect test kit. I have included a copy of the documentation received from Safety Kleen regarding the determination of the total halogen analytical results from the last shipment, which indicates that the resulting halogen content was "PASS < 1000" (Castalloy 51833757 8.19.2010.pdf).

7. Provide a photograph of the container (with label, if applicable) used for collecting baghouse dust in the welding area. Also state which processes contribute wastes to this baghouse.

Photograph attached of the satellite accumulation container used to collect baghouse dust in the welding area. Welding is the only process that contributes wastes to this baghouse.

Regarding the history of the arc air / plasma cutting operation, the cartridge collector was installed in 2010 to improve indoor air quality and reduce the potential for worker exposure, and commenced operation in September 2010. Waste Management is our primary waste contractor, but is only able to handle non-hazardous wastes; therefore, Waste Management coordinates the profiling and disposal of hazardous wastes via Badger Disposal of WI Inc. (Badger).

After the collector first started operation, a non-hazardous waste profile was preliminarily established with the assistance of Badger in 2010 prior to any shipments of the associated wastes, until appropriate characterization testing could be conducted. In December 2010, a sample of the dust that had accumulated was analyzed (TCLP) and determined to be characteristically hazardous due to toxicity for chromium (D007), as documented in an Environmental Monitoring and Technologies, Inc. report (January 6, 2011) that was coordinated by Badger. Based on this information, two new hazardous waste profiles were set-up, including one for the baghouse dust and one for the filter cartridges. The following is a summary of the profiles, which are also referenced in Section 14 of corresponding manifests:

- 1. WS024235, Arc Air / Plasma Fume Collector [Non-Hazardous 2010]
- 2. WS025564, Bag House Dust filter cartridges ERG#171 [Hazardous (D007) 2011]
- 3. WS024861, Bag House Dust ERG#171 [Hazardous (D007) 2011]

Since commencing operation, the majority of the arc air / plasma fume collector waste has been shipped out under either of the two hazardous waste profiles listed above, for the respective waste. However, over this time there were three shipments of arc air / plasma fume collector related waste (2 drums per shipment) that were incorrectly assigned the non-hazardous waste profile number when Waste Management coordinated with Badger for waste pick-up. Consequently, the wastes were inadvertently shipped offsite under non-hazardous waste manifests, namely: 1) Waste Tracking No. 121103 (12-11-2013); 2) Waste Tracking No. 030318 (03-03-2015); and 3) Waste Tracking No. 050120 (05-01-2015).

To resolve this matter, Castalloy has contacted both Waste Management and Badger Disposal, and we have directed Badger to deactivate the non-hazardous waste profile so that it is no longer available — leaving only the hazardous waste profiles to be pre-printed on manifests that they issue when scheduling a pick-up. Internally, we are also in the process of coordinating appropriate instruction to those responsible for signing manifests to reiterate that wastes characterized as hazardous can only be shipped as a hazardous waste using a uniform hazardous waste manifest. Otherwise, the manifest cannot be signed and the waste must remain onsite until the appropriate manifest shipping documentation is obtained, which properly identifies the waste as hazardous. We are confident that these measures are appropriate and will effectively resolve this matter.

After reviewing the attached information, please advise if you need anything further.

Regards,

Bryan Burton

Director of Human Resources/HS&E, North America Castalloy, Inc.

Subject: FW: Re: US EPA inspection at Castalloy - May 20, 2015

Dear Mr. Mullikin,

Thank you for your time and patience during the inspection at your facility on May 20th. I have drafted the inspection report, but have some outstanding questions and requests for you. If possible, please respond to this email no later than June 17, 2015. You may respond electronically, or if you prefer, you may send hard copies in the mail. My mailing information is included at the bottom of this email in case you misplaced my card.

- 1. Please provide all manifests for shipments of hazardous waste for the past three years (May 2012 through May 2015). You need only include the final copy which has been signed by the receiving facility.
- 2. If not clearly stated on the manifests provided in response to Item 1, above, please indicate the following
 - a. The source of the waste streams (by line item)
 - b. The disposition of the waste stream (e.g. landfill, recycle, etc.)
- 3. Provide Land Disposal Restriction (LDR) forms for each hazardous waste (only one form needed per waste stream) sent off-site for disposal. You do not need to include LDRs for wastes that have not been sent off site in over three years.
- 4. Hazardous waste determinations must be made for all solid wastes generated at your facility [see, 40 CFR 262.11]. Generator knowledge may be used to make determinations. A generator may also use sample analyses, such as the Toxicity Characteristic Leaching Procedure (TCLP), in order to make the determinations. All determinations must be supported with written documentation [see, 40 CFR 262.40(c)]. Provide waste determination documentation for the following waste streams:
 - a. Grinding Swarf
 - b. Cutter dust (from the electric arc air cutter and plasma cutter)
 - c. Dust collected in the welding area

- d. Floor sweepings
- e. Sand fines
- f. Shot blast fines
- g. Parts washer solvent (if applicable)
- 5. Provide transporter and receiving facility information for used oil generated on the site. Include the name and EPA ID number of both entities. Also indicate whether the oil is going to be reprocessed, burned, or otherwise.
- 6. For used oil, provide one or more of the following, as applicable:
 - a. the total halogen analytical results;
 - b. information documenting whether or not used oil is mixed with listed hazardous waste (e.g., a chlorinated solvent) if total halogens exceed 1,000 ppm.
- 7. Provide a photograph of the container (with label, if applicable) used for collecting baghouse dust in the welding area. Also state which processes contribute wastes to this baghouse.

Thank you for your attention to this matter. Please contact me if you have any questions, or if you need clarification on any of my requests.

Sincerely, Brenda

Brenda Whitney Environmental Engineer U.S. EPA - Region 5 77 W. Jackson Boulevard, LR-8J Chicago, Illinois 60604 312-353-4796 (ph) 312-385-5505 (fax)

Used oil in drums for non-auto generators classified as high risk. Used oil certification form is required for all customers (initial sign-up and when status changes).

GENERATOR STATUS CESQG: Non-vehicle

Customer certifies that (i) the above-named materials are properly classified, packaged, marked and labeled, and are in proper condition for transportation according to the applicable regulations of the Department of Transportation and (ii) no material change has occurred either in the characteristics of the waste/material or in the process generating the waste/material. Customer agrees to pay the above charges and to be bound by the terms and conditions (1) set forth in (a) the General Terms and Conditions provided separately to Customer or (b) any SK agreement signed by Customer and SK, and (2) incorporated herein by reference. Unless otherwise indicated in the payment received section, SK is authorized to charge Customer's account for this transaction. Customer certifies that the individual signing this Service Acknowledgement is duly authorized to sign and bind Customer. The following provision is applicable to Safety-Kleen's parts cleaner and paint gun cleaner services: Customer agrees that it will not introduce any substance into the solvent or aqueous cleaning solution, including without limitation any hazardous waste or hazardous waste constituent, except to the extent such introduction is incidental to the normal use of the machine. Customer further agrees that it will not clean parts/paint guns that have been contaminated with or otherwise introduce polychlorinated biphenyls (PCB's), herbicides, pesticides, dioxins or listed hazardous waste into the solvent or aqueous cleaning solution. Safety-Kleen has the capacity and is permitted to accept, store, and/or reclaim the spent parts washer solvent; paint thinners, solvents and paints generated by customer; or dry cleaning filter cartridges, powder, and still residues containing perchloroethylene, petroleum naphtha, or triflurotrichloroethane dry cleaning solvents. Safety-Kleen and customer agree that this agreement is intended to satisfy the requirements of 40 CFR 262.20(e). IN THE EVENT OF AN EMERGENCY CALL 1-800-468-1760 (24 hours)
